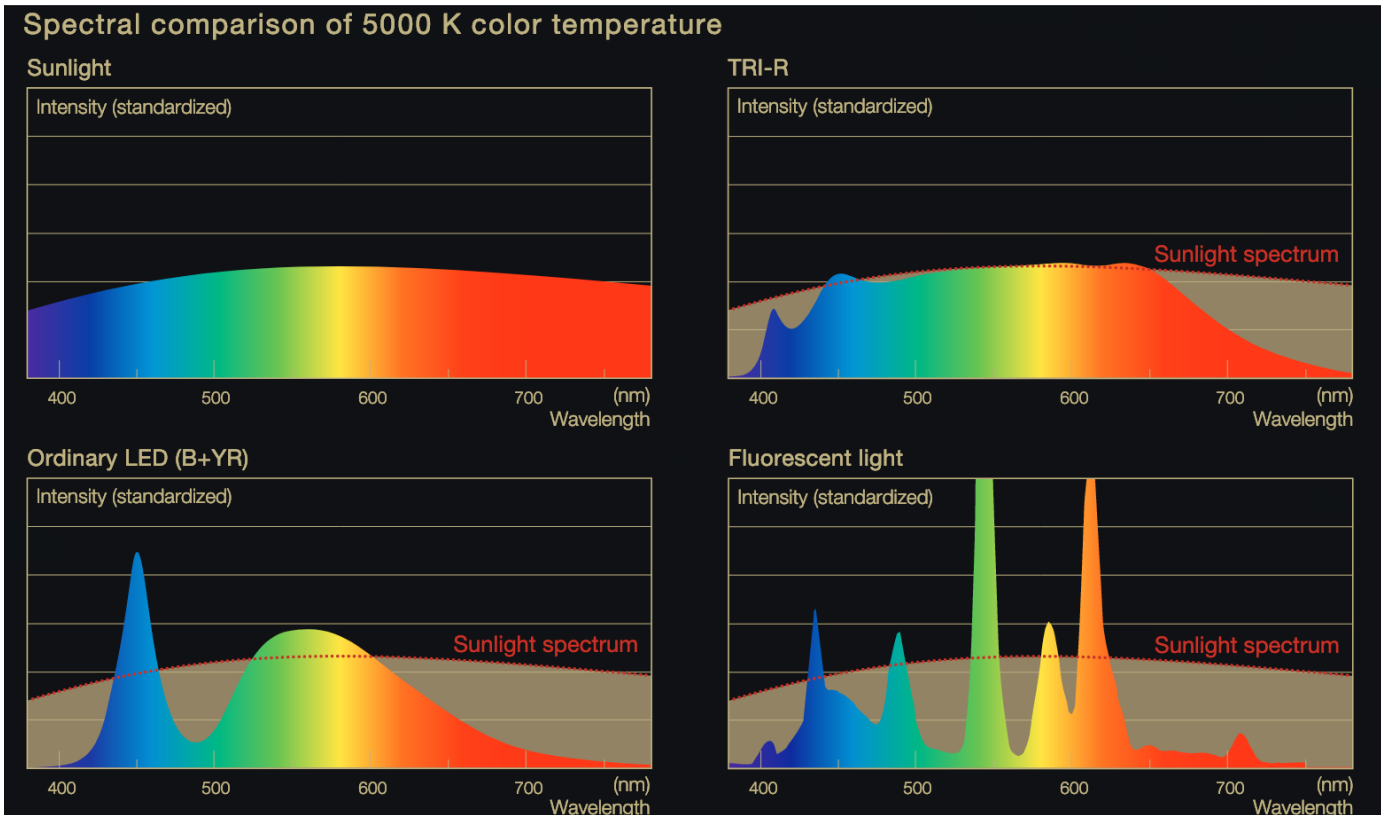
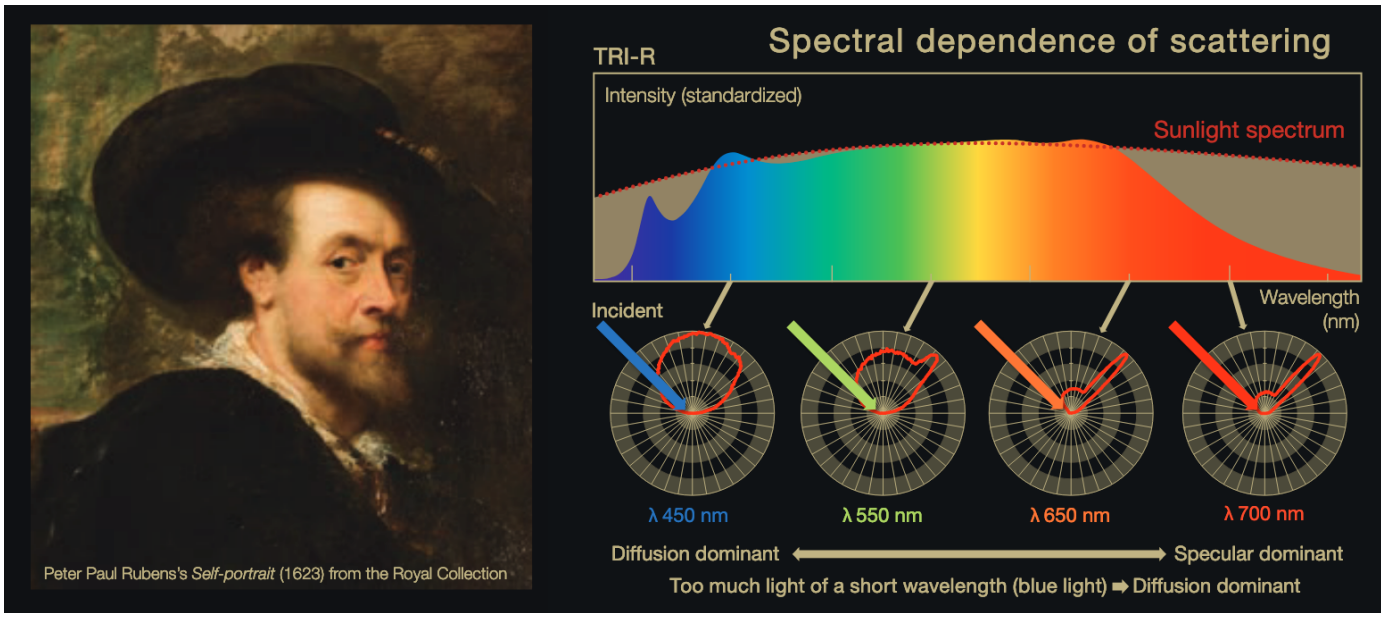
SunLike Natural Spectrum LEDs reveal the true color and depth of artistic works

Ledrise Led Professional

Seoul Semiconductor's SunLike Series, equipped with TRI-R technology, represents a groundbreaking advancement in LED lighting. These true natural spectrum LEDs produce light that closely emulates the spectrum of natural sunlight, thanks to a novel LED architecture. By using a purple emitter combined with a red, green, and blue (RGB) phosphor mix, SunLike LEDs offer significant improvements over conventional white LEDs, which rely on a blue emitter and yellow phosphor.



This innovative approach to full-spectrum LED lighting results in accurate color rendering, heightened awareness of contrast and texture, and an overall superior visual experience. In this article, we will delve into the unique properties of SunLike LEDs and their applications in art and museum lighting, which are truly transformative.



The high quality of SunLike LEDs' light spectrum is reflected in both traditional color rendering index (CRI) and the newer Color Fidelity Index (Rf). SunLike LEDs boast a CRI of 98+ and an Rf of 96 (TM30 Fidelity Index), which indicate their impressive accuracy in reproducing original colors from 99 representative color indexes.

By utilizing a three-phosphor mix, SunLike LEDs create a uniform spectral power distribution that renders colors naturally and authentically. This makes them ideal for lighting art, such as paintings, frescoes, mosaics, sculptures, and other exhibits. As more museums and historic sites adopt SunLike LED fixtures, visitors worldwide will have the opportunity to experience art in a new light.

SunLike LEDs reveal more color and depth at the murals in the ruins of Pompeii

Seoul Semiconductor's custom solid-state lighting (SSL) lights, based on SunLike LEDs, have revolutionized the way ancient murals at the ruins of Pompeii are displayed. The LED technology is designed to make objects appear as if they were being illuminated by natural sunlight, revealing more color and depth in the murals.

Uniform spectral power distribution enabled by a three-phosphor mix render ancient murals naturally, ensuring that visitors will fully experience the display's color and texture.

SunLike LEDs deliver a 97-plus rating for CRI, Rf, and Color Quality Scale (CQS). These high CQS scores indicate that the human eye can perceive both bold, saturated colors and subtle nuances with ease. In the case of the Pompeii ruins, the uniform spectral power distribution (SPD) and superior color rendering offered by SunLike LEDs enable visitors to see colors accurately. Moreover, the packaged LEDs create a high contrast ratio, allowing viewers to better perceive depth and texture in the murals.

Grevin Museum in Paris Adopts SunLike LED Technology

The Grevin Museum in Paris, a renowned wax museum, has installed lights based on Seoul SunLike LEDs to illuminate figures ranging from celebrities and scientists to historical figures. This lighting upgrade allows visitors to experience vivid colors and subtle details in the art works, resulting in a more lifelike appearance of the wax figures.

A museum lighting installation at the Grevin in Paris brings high-quality illumination to wax exhibits via lights that rely on Seoul Semiconductor's SunLike LED technology. (Photo credit: Image courtesy of Seoul Semiconductor.)

The new fixtures produce more realistic color tones compared to the previous lighting system. Furthermore, the absence of a blue peak in the new lighting system eliminates scattered reflections and glare, significantly enhancing the overall visual experience. The Grevin Museum, located on Boulevard Montmartre, features exhibits that include famous individuals such as Albert Einstein, Michael Jackson, and Katy Perry, all now illuminated by the cutting-edge SunLike LED technology.

Future Applications of SunLike LEDs

Seoul Semiconductor's SunLike Series LEDs with TRI-R technology have revolutionized the world of lighting design, particularly in the realm of art and museum lighting. By closely matching the spectrum of natural sunlight and providing unparalleled color rendering, contrast, and texture awareness, these true natural spectrum LEDs offer an unmatched visual experience.

As more institutions, such as the Pompeii ruins and the Grevin Museum in Paris,

adopt SunLike LED technology, visitors around the world will be able to appreciate the beauty of art and historical exhibits in a way never before possible. This innovative lighting solution not only enhances the visual appeal of these masterpieces but also helps preserve their integrity by reducing the damage caused by traditional lighting sources.

The success of SunLike LEDs in art and museum lighting opens up a world of possibilities for their application in other fields. For instance, retail spaces can benefit from the accurate color rendering and natural appearance of products under SunLike LEDs. This can lead to increased customer satisfaction and sales, as customers will be able to view products in a more authentic light.

Similarly, the healthcare industry can utilize SunLike LEDs to create a more natural and comfortable environment for patients and medical staff. The true natural spectrum light may contribute to a sense of well-being, potentially reducing stress and aiding in the healing process.

In the film and photography industries, SunLike LEDs can provide a more accurate representation of colors and textures, allowing artists to capture images that more closely resemble the real world. This can lead to improved quality and realism in the final product.

Even residential and commercial spaces can benefit from the adoption of SunLike LED technology. By providing a more natural and visually comfortable environment, these LEDs can contribute to increased productivity and overall well-being for occupants.

Seoul Semiconductor's SunLike Series LEDs have the potential to revolutionize not only art and museum lighting but also various other industries that rely on high-quality, natural-looking light. As the world continues to embrace this groundbreaking LED technology, the impact of SunLike LEDs will undoubtedly be felt across countless sectors, improving the way we see and experience the world around us.

Easy to build SunLike LED fixtures thanks to our LED strips & modules

With our LumiFlex3098+ SunLike LED strips you will have a brilliant natural light source easy to install over long distances, perfect for cove lights, architectural or indirect lighting and with our LumiBar SunLike LED modules you can easily build linear lighting fixtures thanks to the plug & play connection and Zhaga format.
